Global Positioning System (GPS) navigation-based Tools

Definition (provided courtesy of Garmin's Web site): The Global Positioning System (GPS) is a satellite-based navigation system made up of a network of 24 satellites placed into orbit by the U.S. Department of Defense. GPS was originally intended for military applications, but in the 1980s, the government made the system available for civilian use. GPS works in any weather conditions, anywhere in the world, 24 hours a day. There are no subscription fees or setup charges to use GPS.

[Karsten Kutza's Web site](#) has the following introduction: "Every newcomer to the field of artificial neural networks, who wants to build own applications based on own software simulators, faces two major problems: turning the theory of a particular network model into the design for a simulator implementation can be a challenging task, and often it is not obvious how to embed an application into a particular network model. The programs on this site deal with both these issues. You will find: ready-to-reuse software simulators for eight of the most popular neural network architectures, coded in portable, self-contained ANSI C, with complete example applications from a variety of well-known application domains."
